

Gulf of Mexico Harmful Algal Bloom Bulletin

Region: Texas

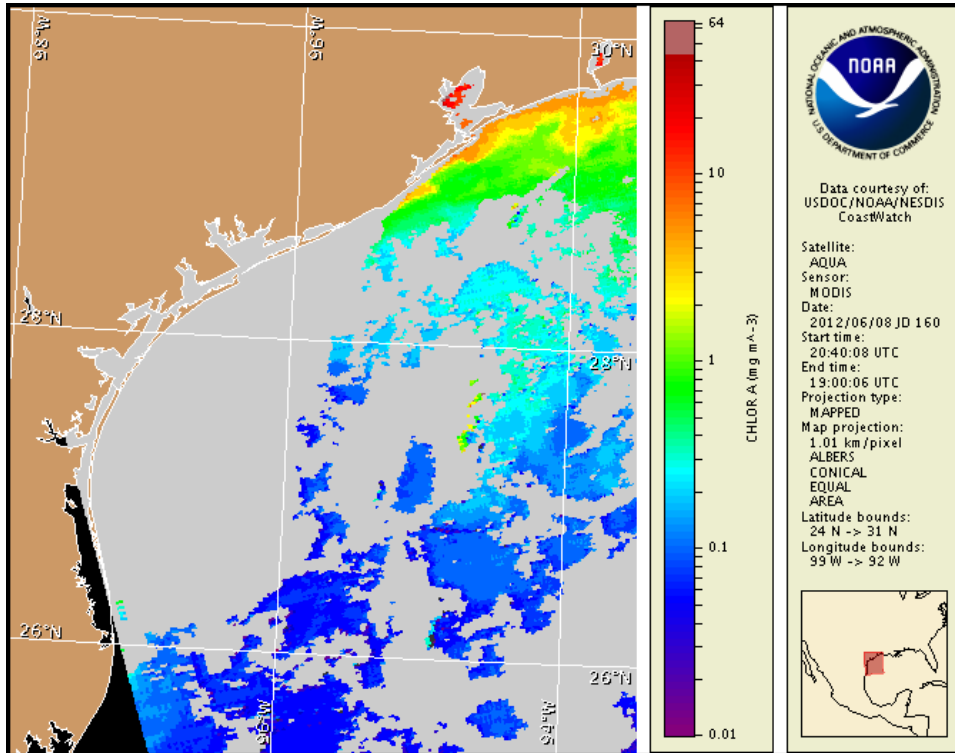

Monday, 11 June 2012

NOAA Ocean Service

NOAA Satellite and Information Service

NOAA National Weather Service

Last bulletin: Monday, June 4, 2012

Satellite chlorophyll image with possible HAB areas shown by red polygon(s). Cell concentration sampling data from June 1 to 7 shown as red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). For a list of cell count data providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

Conditions Report

There is currently no indication of a harmful algal bloom of *Karenia brevis* (Texas red tide) at the coast in Texas. No impacts are expected alongshore Texas today through Sunday, June 17. There is currently a bloom of the algae *Aureocumbra lagunensis* in the upper Laguna Madre region. This algae does not produce respiratory impacts associated with the Texas red tide caused by *Karenia brevis*, but it may cause discolored water.

Analysis

There is currently no indication of a harmful algal bloom of *Karenia brevis* at the coast in Texas. Recent MODIS imagery (6/8; shown left) is obscured by clouds from the Matagorda Peninsula to the South Padre Island region, limiting analysis. Elevated chlorophyll (1 to 5 $\mu\text{g/L}$) is visible stretching along- and offshore the Texas coastline from Sabine Pass to the Matagorda Peninsula. Elevated chlorophyll is not indicative of the presence of *K. brevis* and is most likely due to the resuspension of benthic chlorophyll and sediments along the coast. Forecast models based on predicted near-surface currents indicate a potential negligible transport (<10km) north from the Port Aransas region from June 8-14.

Kavanaugh, Derner

Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts. Wind observation and forecast data provided by NOAA's National Weather Service (NWS).

Wind Analysis

Port Aransas: Southeast winds (10-20kn, 5-10m/s) today through Tuesday becoming south winds after midnight Tuesday night. Southeast winds (10-20kn, 5-10m/s) Wednesday through Friday night.

Satellite chlorophyll image and forecast winds for June 12, 2012 12Z with cell concentration sampling data from June 1 to 7 shown as red (high), orange (medium), yellow (low b), brown (low a), blue(very low b), purple (very low a), pink (present), and green (not present). For a list of cell count data providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Verified and suspected HAB areas shown in red. Other areas of high chlorophyll concentration shown in yellow (see p. 1 analysis for interpretation).
